

Field CHA-015

102 acres in Champaign County, Illinois. What the satellite record shows for the 2026 season.

Prepared Oct 6, 2026
Imagery through Oct 2, 2026
Villicus

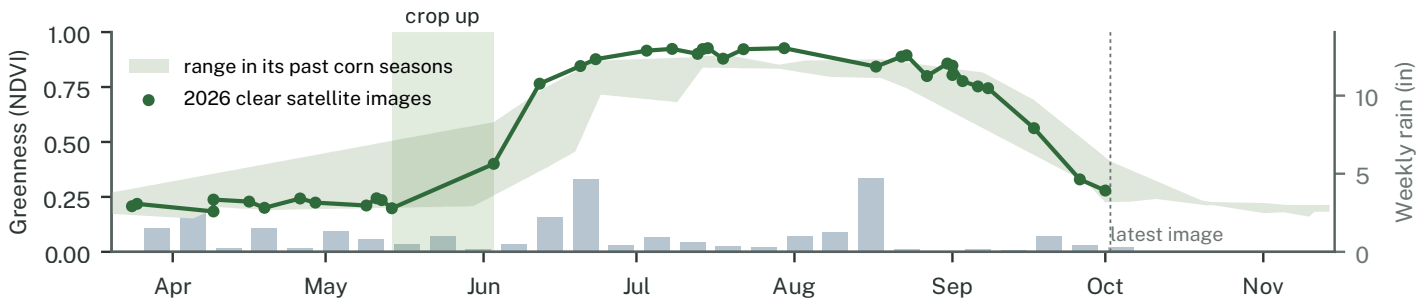

USDA NAIP aerial photo, 2023. Field boundary in yellow.

2026 crop	Corn (high confidence)
Crop came up	between May 14 and Jun 3, so likely planted Apr 30 to May 27
Harvest	crop had dried down by Sep 26; harvest not yet seen as of Oct 1
After the 2025 harvest	Tilled (fall); residue dropped between Oct 16, 2025 and Oct 31, 2025
Winter 2025-26	Unclear: a little green in 11 winter images, below the cover-crop threshold
Season greenness	1st greenest of its 4 corn seasons since 2020; 75th percentile of 1,520 Champaign County corn fields

2019 Soybeans	2020 Corn	2021 Soybeans	2022 Corn	2023 Soybeans	2024 Corn	2025 Soybeans	2026 Corn
------------------	--------------	------------------	--------------	------------------	--------------	------------------	--------------

Crop by year: USDA Cropland Data Layer 2019-2025; 2026 from our model.

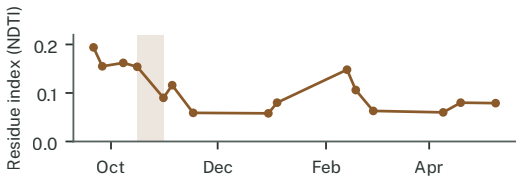

The 2026 season

After the 2025 harvest

Oct 16, 2025, Sentinel-2 (before)
Oct 31, 2025, Sentinel-2 (after)

Worth a look

Nothing inside the boundary stood out in the last four seasons: no persistent low spots, no hot spots, no change in land use.

This field is in corn for 2026, and the crop was up by Jun 3. Harvest has not shown up in the imagery yet; the latest clear image is from Oct 1. Through the summer it stayed ahead of most corn fields in the county (75th percentile on greenness), which tracks crop vigor but is not a yield estimate. It was tilled after last year's harvest (between Oct 16, 2025 and Oct 31, 2025), and nothing inside the boundary stood out as a problem area.

Evidence. Dates above rest on these satellite scenes: Oct 16 2025, tillage (S2C T16TDK orbit 126); Oct 31 2025, tillage (S2B T16TDK orbit 126); May 14 2026, crop up (S2C T16TDK orbit 126); Jun 3 2026, crop up (S2C T16TDK orbit 126); Jul 15 2026, peak (Landsat 8 path/row 022032); Sep 17 2026, dry-down (Landsat 8 path/row 022032); Sep 26 2026, dry-down (S2B T16TDK orbit 126); Oct 1 2026, harvest (S2C T16TDK orbit 126). The chart and winter checks use 82 clear images from Aug 2025 on, all listed in the field record file.

How it was made. Greenness is NDVI and the residue index is NDTI, averaged 10 m inside the boundary (USDA NASS Crop Sequence Boundaries). Crop up is when greenness first passed 0.30; planting is estimated 1-2 weeks earlier. Hot spots use Landsat 8/9 surface temperature. Season greenness tracks crop vigor and is not a yield estimate.
